

Keep software up-to-date

Updates give you new features and also fix security vulnerabilities (bugs) that attackers might take advantage of.

- 1** Check your apps and OS are up-to-date. Go into 'settings' and check nothing needs updating.
- 2** Set your devices to auto-update where possible and don't postpone software updates.
- 3** Check your devices are still supported by their manufacturers. Go into 'Settings' and check when your OS software was installed - if it was months or years ago, it probably means it is no longer supported. It might be time for a replacement!
